Mental Health Case Tracking System

By Ashish SK Gupta

Index

1. Problem Statement
2. Solution
3. Working (Method/Mind map)
4. Conclusion.

Note: Slides (excluding Thank-you and Introduction slide) should not be more than 4.

Problem Statement

The Challenge

Mental health cases need confidential long-term tracking.

Paper records risk privacy leaks and are hard to manage.

Counsellors need a secure digital system to manage patient records and therapy sessions.

Objectives & Requirements

- Ensure confidential case management
- Case registration with unique IDs
- Session tracking per patient
- Secure login / password protection
- Persistent & secure data storage

Solution

Login / Register

Username & password saved
in users.txt

Checks for duplicate usernames

Simple direct comparison

Case Registration

Unique IDs (C0001, C0002...)

Patient name, age, concern

Severity level tracking

Saved in cases.txt

Session Tracking

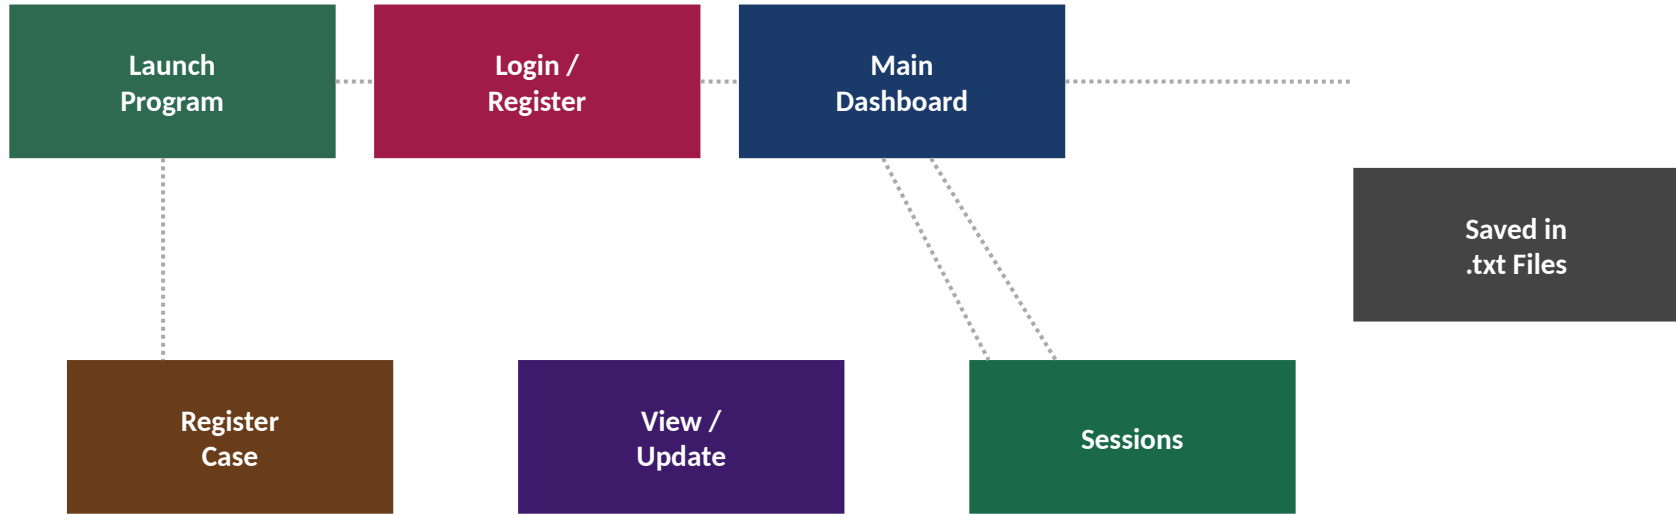

Session IDs (S0001, S0002...)

Duration + notes per visit

Linked to Case ID

Saved in sessions.txt

Working — System Flow

Conclusion

- ✓ Built a complete Mental Health Case Tracking System in C++ (under 200 lines)
- ✓ Secure login & registration — username and password saved in users.txt
- ✓ Case registration with unique auto-generated IDs (C0001, C0002...) and severity
- ✓ Session tracking links therapy sessions to cases with duration and notes
- ✓ All data saved persistently in .txt files — no external library or database needed
- ✓ Covers all deliverables: case registration, session tracking, secure data storage
